### Foreword

This Technical Specification (TS) has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

#### where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

### 1 Scope

The present document contains an electronic copy of the ANSI-C code for the Adaptive Multi-Rate Wideband codec. The ANSI-C code is necessary for a bit exact implementation of the Adaptive Multi Rate Wideband speech transcoder (3GPP TS 26.190 [2]), Voice Activity Detection (3GPP TS 26.194 [6]), comfort noise (3GPP TS 26.192 [4]), source controlled rate operation (3GPP TS 26.193 [5]) and example solutions for substituting and muting of lost frames (3GPP TS 26.191 [3]).

#### 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

#### 3 Definitions and abbreviations

#### 3.1 Definitions

Definition of terms used in the present document, can be found in 3GPP TS 26.190 [2], 3GPP TS 26.191 [3], 3GPP TS 26.192 [4], 3GPP TS 26.193 [5] and 3GPP TS 26.194 [6].

#### 3.2 Abbreviations

For the purpose of the present document, the following abbreviations apply:

AMR-WB	Adaptive Multi-Rate Wideband
ANSI	American National Standards Institute
ETS	European Telecommunication Standard
GSM	Global System for Mobile communications
I/O	Input/Output

RAM Random Access Memory ROM Read Only Memory

#### 4 C code structure

This clause gives an overview of the structure of the bit-exact C code and provides an overview of the contents and organization of the C code attached to this document.

The C code has been verified on the following systems:

- Sun Microsystems workstations and GNU gcc compiler
- HP workstations and cc compiler
- IBM PC compatible computers with Windows NT4 operating system and GNU gcc compiler.

ANSI-C was selected as the programming language because portability was desirable.

#### 4.1 Contents of the C source code

The C code distrubution has all files in the root level.

The distributed files with suffix "c" contain the source code and the files with suffix "h" are the header files. The ROM data is contained mostly in files with suffix "tab".

The C code distribution also contains one speech coder installation verification data file, "spch\_dos.inp". The reference encoder output file is named "spch\_dos.cod", the reference decoder input file is named "spch\_dos.dec" and the reference decoder output file is named "spch\_dos.out". These four files are formatted such that they are correct for an IBM PC/AT compatible computer. The same files with reversed byte order of the 16 bit words are named "spch\_unx.inp", "spch\_unx.cod", "spch\_unx." and "spch\_unx.out", respectively.

Final verification is to be performed using the GSM Adaptive Multi-Rate Wideband test sequences described in 3GPP TS 26.174 [1].

Makefiles are provided for the platforms in which the C code has been verified (listed above). Once the software is installed, this directory will have a compiled version of *encoder* and *decoder* (the bit-exact C executables of the speech codec) and all the object files.

## 4.2 Program execution

The GSM Adaptive Multi-Rate Wideband codec is implemented in two programs:

- (encoder) speech encoder;
- (decoder) speech decoder.

The programs should be called like:

- encoder [encoder options] <speech input file> <parameter file>;
- decoder <parameter file> <speech output file>.

The speech files contain 16-bit linear encoded PCM speech samples and the parameter files contain encoded speech data and some additional flags.

The encoder and decoder options will be explained by running the applications without input arguments. See the file readme.txt for more information on how to run the *encoder* and *decoder* programs.

## 4.3 Code hierarchy

Tables 1 to 3 are call graphs that show the functions used in the speech codec, including the functions of VAD, DTX, and comfort noise generation.

Each column represents a call level and each cell a function. The functions contain calls to the functions in rightwards neighboring cells. The time order in the call graphs is from the top downwards as the processing of a frame advances.

All standard C functions: printf(), fwrite(), etc. have been omitted. Also, no basic operations (add(),  $L_add()$ , mac(), etc.) or double precision extended operations (e.g.  $L_Extract()$ ) appear in the graphs. The initialization of the static RAM (i.e. calling the \_init functions) is also omitted.

The basic operations are not counted as extending the depth, therefore the deepest level in this software is level 6.

The encoder call graph is broken down into two separate call graphs, Table 1 to 2.

## 4.5 Variables, constants and tables

The data types of variables and tables used in the fixed point implementation are signed integers in 2's complement representation, defined by:

- Word16 16 bit variable;
- Word32 32 bit variable.

## 4.5.1 Description of constants used in the C-code

This subclause contains a listing of all global constants defined in cnst.h.

**Table 5: Global constants** 

Constant	Value	Description
L_TOTAL	384	total size of speech buffer.
L_WINDOW	384	window size in LP analysis
L_NEXT	64	Look-ahead size
L_FRAME	256	frame size in 12.8 kHz
L_FRAME16k	320	frame size in 16 kHz
L_SUBFR	64	Subframe size in 12.8 kHz
L_SUBFR16k	80	Subframe size in 16 kHz
NB_SUBFR	4	Number of subframes
M16k	20	order of LP filter in high-band synthesis in 6.60 mode
M	16	order of LP filter
L_FILT16k	15	Delay of down-sampling filter in 16 kHz
L_FILT	12	Delay of down-sampling filter in 12.8 kHz
GP_CLIP	15565	Pitch gain clipping
PIT_SHARP	27853	pitch sharpening factor
PIT_MIN	34	minimum pitch lag (all modes)
PIT_FR2	128	Minimum pitch lag with resolution ½
PIT_FR1_9b	160	Minimum pitch lag with resolution for 9 bit quantization
PIT_FR1_8b	92	Minimum pitch lag with resolution for 8 bit quantization
PIT_MAX	231	maximum pitch lag
L_INTERPOL	(16+1)	length of filter for interpolation
OPL_DECIM	2	Decimation in open-loop pitch analysis
PREEMPH_FAC	22282	preemphasis factor
GAMMA1	30147	Weighting factor (numerator)
TILT_FAC	22282	tilt factor (denominator)
Q_MAX	8	scaling max for signal
RANDOM_INITSEED	21845	random init value
L_MEANBUF	3	Size of ISF buffer
ONE_PER_MEANBUF	10923	Inverse of L_MEANBUF

### 4.5.2 Description of fixed tables used in the C-code

This section contains a listing of all fixed tables sorted by source file name and table name. All table data is declared as **Word16**.

## 5 Homing procedure

The principles of the homing procedures are described in [2]. This specification only includes a detailed description of the 9 decoder homing frames. For each AMR-WB codec mode, the corresponding decoder homing frame has a fixed set of parameters. The parameters in serial format are packed into parameters in 15-bit-long format where the first serial bit is inserted into most significant bit in the 15-bit-long format. These 15-bit-long parameters do not represent real speech parameters, but they decrease memory consumption compared to the speech parameters. Table 9 shows the homing frame in 15-bit-long format for different modes. In the decoder, the received speech parameters in serial format are first converted into 15-bit-long format. Then the obtained parameters are compared against the homing frame table values (Table 9).

## 6 File formats

This section describes the file formats used by the encoder and decoder programs. The test sequences defined in [1 also use the file formats described here.

## 6.1 Speech file (encoder input / decoder output)

Speech files read by the encoder and written by the decoder consist of 16-bit words where each word contains a 14-bit, left aligned speech sample. The byte order depends on the host architecture (e.g. MSByte first on SUN workstations, LSByte first on PCs etc.). Both the encoder and the decoder program process complete frames (of 320 samples) only.

This means that the encoder will only process n frames if the length of the input file is n\*320 + k words, while the files produced by the decoder will always have a length of n\*320 words.

## 6.2 Mode control file (encoder input)

The encoder program can optionally read in a mode control file which specifies the encoding mode for each frame of speech processed. The file is a text file containing one number per speech frame. Each line contains one of the mode numbers 0-8.

#### 6.3 Parameter bitstream file (encoder output / decoder input)

The files produced by the speech encoder/expected by the speech decoder contain an arbitrary number of frames in the following available formats.

#### NOTE ON DEFAULT 3GPP AND ITU BITSTREAM FORMATS:

ITU stream format gives very limited possibilities to distinguish NO\_DATA and SID\_FIRST frame types at the beginning of a stream. In some very limited cases for which some instance between encoder and decoder cuts of the first hangover period frames (e.g. handovers, editing of the stream), the output of the decoder is different depending on the stream format, ITU or default 3GPP.

#### **Default 3GPP format:**

This is the default format used in 3GPP. This format shall be used when the codec is tested against the test vectors.

TYPE_OF_FRAME_TYPE	FRAME_TYPE	MODE	В1	В2	 Bnn

Each box corresponds to one Wordl6 value in the bitstream file, for a total of 3+nn words or 6+2nn bytes per frame, where nn is the number of encoded bits in the frame. Each encoded bit is represented as follows: Bit 0 = 0xff81, Bit 1 = 0x007f. The fields have the following meaning:

As indicated in section 6.1 above, the byte order depends on the host architecture.

#### ITU format (activated with command line parameter -itu)

SYNC_WORD	DATA_LENGTH	В1	В2	 Bnn

Each box corresponds to one Word16 value in the bitstream file, for a total of 2+nn words or 4+2nn bytes per frame, where nn is the number of encoded bits in the frame. Each encoded bit is represented as follows: Bit 0 = 0x007f, Bit 1 = 0x0081. The fields have the following meaning:

SYNC\_WORD Word to ensure correct frame synchronization between the encoder and the

decoder. It is also used to indicate the occurrences of bad frames.

In the encoder output: (0x6b21)

In the decoder input: Good frames (0x6b21)

Bad frames (0x6b20)

DATA\_LENGTH

Length of the speech data. Codec mode and frame type is extracted in the decoder using this parameter:

#### MIME/file storage format (activated with command line parameter -mime)

Detailed description of the AMR-WB single channel MIME/file storage format can be found in [7] (sections 5.1 and 5.3). This format is used e.g. by the Multimedia Messaging Service (MMS).
